## OEM TEC Controller

### Description:

The TEC-1161 is a specialized TEC Controller / power supply able to precision-drive two Peltier elements.

Each channel features a true bipolar DC current source for cooling / heating, six temperature monitoring inputs (2x high resolution, 4x low resolution) and intelligent PID control with auto tuning. The TEC-1161 is fully digitally controlled, it's hard- and firmware offer numerous communication and safety options.

The included PC-Software allows configuration, control, monitoring, and live diagnosis of the TEC Controller via USB and RS485. All parameters can be saved to non-volatile memory.

For the most straightforward applications, only a power supply, Peltier elements and at least one temperature sensor need to be connected to the TEC-1161. After power-up the unit will operate according to pre-configured values. (In stand-alone mode no control interface is needed.)

The TEC-1161 can handle either Pt100, Pt1000, NTC or Voltage temperature probes. For highest precision and stability applications a Pt100 / 4-wire input configuration is recommended. Analog measurement circuit is factory calibrated.

Low resolution temperature inputs allow the connection of NTC probes that are located on the heat sinks of the Peltier elements. This additional data is used to compensate for parasitic thermal conduction of Peltier elements. Also, it allows the control of external heat sink cooling fans.

The heating and cooling power is optimized by proprietary thermal management routines based on power balance models (for Peltier elements and resistive heaters).

The TEC-1161 two independent channels may also be operated in parallel to either drive two individual or one common load (current doubling).

Further functionality includes: Smooth temperature ramping, thermal stability indication and auto gain (NTC probes). The PC-Software allows data logging and configuration import/export.

The controller limits the output current for each channel dynamically if the max input current limit is reached.

## Operation Modes / Theory of Operation

The TEC-1161 is an OEM precision TEC Controller that is available with Screw Terminals or as a PCB mountable device. Its basic operation status is visually indicated by on-board green and red LEDs and their blinking pattern.

SCREW Screw terminal equipped Version

PIN PCB mountable Version

Status information can be polled at any time by industry standard RS485 connection or by USB (see box below). The TEC-1161 can also operate in a remotely controlled manner, with parameters adjusted on the fly. Scripting capability by sequential lookup table read-out is supported.

Configured as a DC power-supply, the TEC-1161 can handle current and voltage settings. In the remote-control case, temperature data may be passed on to be processed by the host.

Configurable parameters further include sensor linearization (Pt100 / Pt1000) and Steinhart-Hart modeling (NTC), temperature acquisition hardware calibration, Peltier element modeling, PID controller auto tuning, nominal temperature ramping, current, voltage and temperature limits, error thresholds, etc. Please refer to the TEC Controller User Manual (Document 5216) for further information.
